AI Interview Copilot

How the app works

Setup, everyday use, what happens inside, settings, cost, sharing your key and fixing problems.

VERSION	**1.3.0**
PLATFORM	**Windows 10 and 11**
AI PROVIDER	**Google Gemini**
LANGUAGE	**English**
DATE	**November 2026**

Real-time answer suggestions during your interviews, grounded in your own experience.

Contents

How to read this guide

- **Sections 1 to 4** are for everyone: what the app does, how to install it, and how to use it before, during and after an interview.
- **Sections 5 to 7** explain what happens inside the app, where your data goes and how key files work.
- **Sections 8 to 13** are reference: every setting, cost, measured speed, updates, problems and limits.
- Words in **bold** are the names of buttons and pages as they appear in the app.

1. What the app does

AI Interview Copilot listens to a live job interview on your Windows computer. When the interviewer asks a question, it shows a short answer you can say, about one second after they stop talking. The answer is built from your own resume and your own notes, so it sounds like you and stays true.

In one interview, the app:

- **Listens to both sides.** The interviewer comes from your computer's sound (Zoom, Teams, Meet or any other call app). You come from your microphone. Keeping the two apart tells the app who is speaking.
- **Writes down what is said** as a live transcript, using Google Gemini.
- **Notices when a question is finished**, so it does not answer half a question or small talk that needs no answer.
- **Shows an answer**: one opening sentence you can say at once, then two to four short points.
- **Checks the answer** against your profile and notes, and underlines anything they do not support, so you do not say something untrue.
- **Saves the interview** (text only, never audio) in Sessions, with the answers and the cost.

The parts of the app

Page	What it is for
Home	A checklist of five setup steps, and your recent interviews.
Interview	Start, pause and end an interview. Shows the answer and the transcript.
Sessions	Past interviews: transcript, suggested answers, cost. Copy, save or delete them.
Profiles	Your resume, turned into a profile the app can use. You review and edit it.
Knowledge	Your notes for an application: stories, salary, why this company, how you like to answer.
Answer bank	Prepared answers to common questions. You approve them before they are used.
Audio	Choose the microphone and the call sound, and test that both sides are heard.
Settings	API key, key files, models, answer style, copilot window, phone, shortcuts, privacy.
Copilot window	A small window that floats over your call during an interview. It can be hidden from screen sharing.
Phone screen	Optional: the same answers on your phone, in its web browser.

Does the app learn from my interviews?

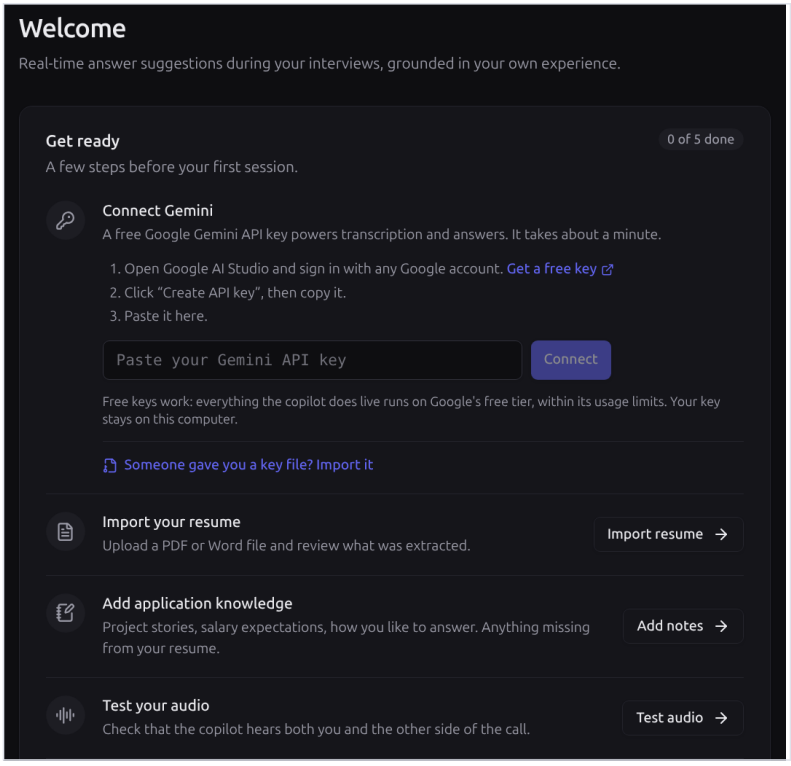

- No. It does not train itself or a model. Google's models stay the same.
- During one interview it remembers what was said, so follow-up answers stay consistent with what you already answered.
- What makes answers better over time is what **you** add: a better profile, more notes, and approved answers in the Answer bank. Those are used in every interview.

2. Install and set up

Setup takes about ten minutes. The Home page walks you through it: connect Gemini, import your resume, add your notes, test your audio, start an interview.

Install

1. Download `AI-Interview-Copilot-Setup-1.3.0-x64.exe` from the project's GitHub Releases page (or from the file the owner sent you).
2. Run it. It installs for your Windows user only and does not need admin rights.
3. Windows may show **Windows protected your PC** (SmartScreen), because the installer is not signed with a paid certificate. Click **More info**, then **Run anyway**.
4. The app opens on the Home page. Later versions install themselves (see section 11).

The Home page on first start: five steps, starting with the Gemini key.

Step 1 · Connect Gemini (an API key)

The app uses Google Gemini for transcription and answers. It needs a Gemini API key. You can get one for free, or use a key file someone gave you.

A free key of your own

1. On Home, click **Get a free key**. Google AI Studio opens. Sign in with any Google account.
2. Click **Create API key** and copy it.
3. Paste it into the app and click **Connect**. The app checks the key and picks the best models it can use.

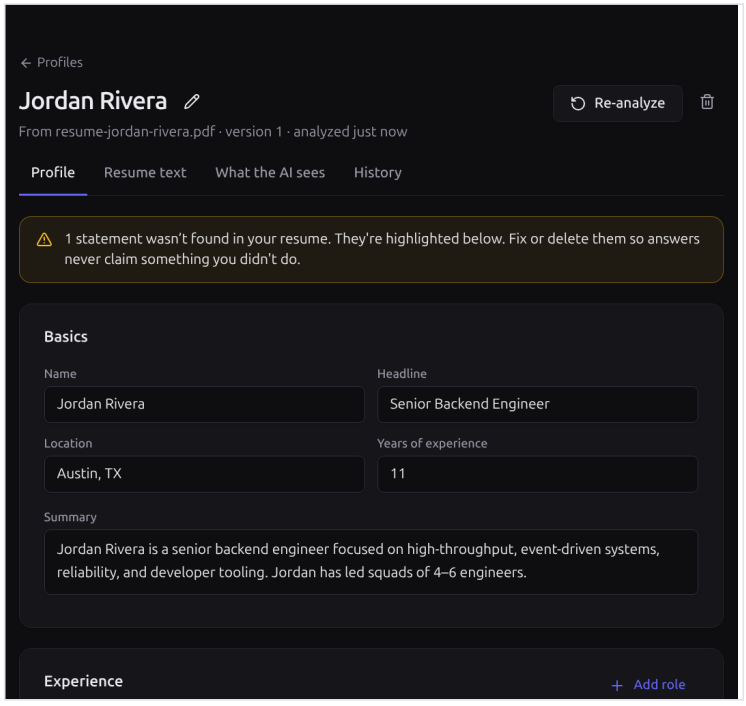

A key file from someone else

If the owner gave you an `.aickey` file and a password, click **Someone gave you a key file? Import it**, choose the file and type the password. The app never shows you the key itself. See section 7.

> **Free keys work**
> Everything the copilot does live runs on Google's free tier, within its usage limits. When a free key cannot use the stronger Pro model, preparation (reading your resume, drafting answers) uses `gemini-3.8-flash` instead, and Quality answers use Fast mode. Google may use free-tier content to improve its products; a key with billing turned on avoids that.

Step 2 · Import your resume (Profiles)

- Click **Import resume** and choose a PDF or Word (`.docx`) file. Old `.doc` files are not supported.
- Gemini reads the resume and builds a profile: your roles, skills, highlights and achievements.
- **Every statement comes with a quote** from the resume. The app looks for that quote in the file. If it cannot find it, the statement is marked for you to review, so mistakes are visible before they reach an answer.
- Edit anything you like. Each change is saved as a new version, and you can go back to an older one.

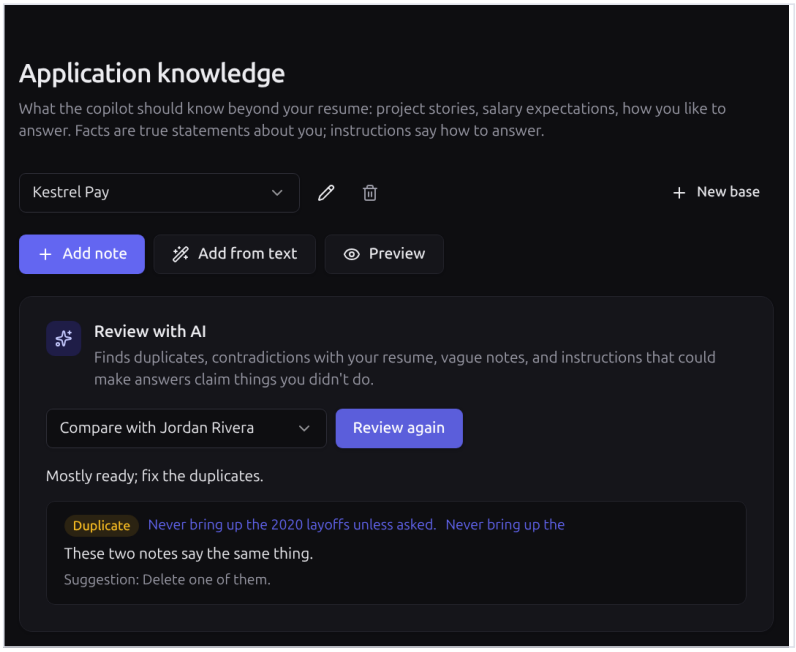

A profile after import. Statements the app could not find in the resume are flagged for review.

Step 3 · Add application knowledge (Knowledge)

Notes are what your resume does not say: project stories, why you want this job, your salary expectations, what to avoid, how you like to answer. Group them in a knowledge base, for example one per company.

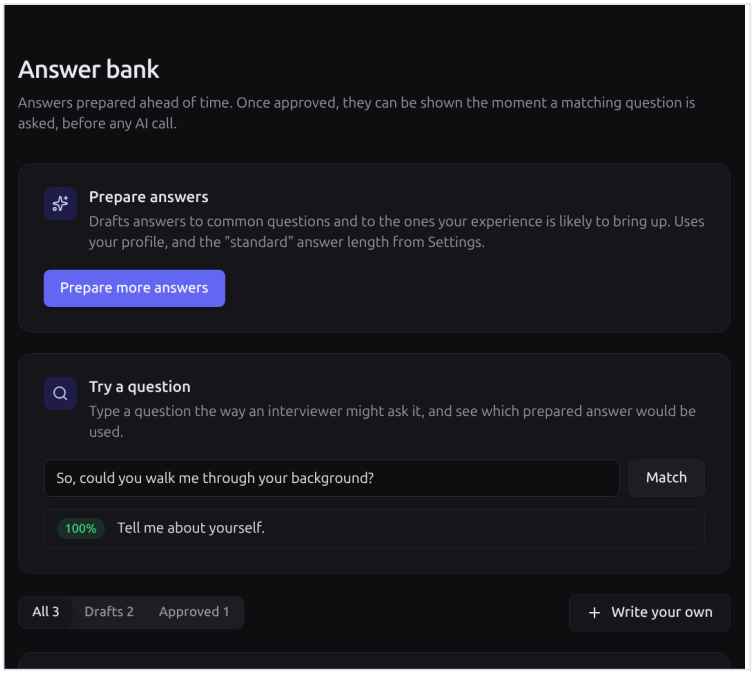

- Each note is a **fact** (something true about you) or an **instruction** (how to answer).
- You can paste a long text and let the app split it into notes. You review them before saving.
- **Review** asks Gemini to look for duplicates, conflicts, unclear notes and risky instructions.

Knowledge: notes for one application, and a review that found a duplicate.

Optional · Prepare answers (Answer bank)

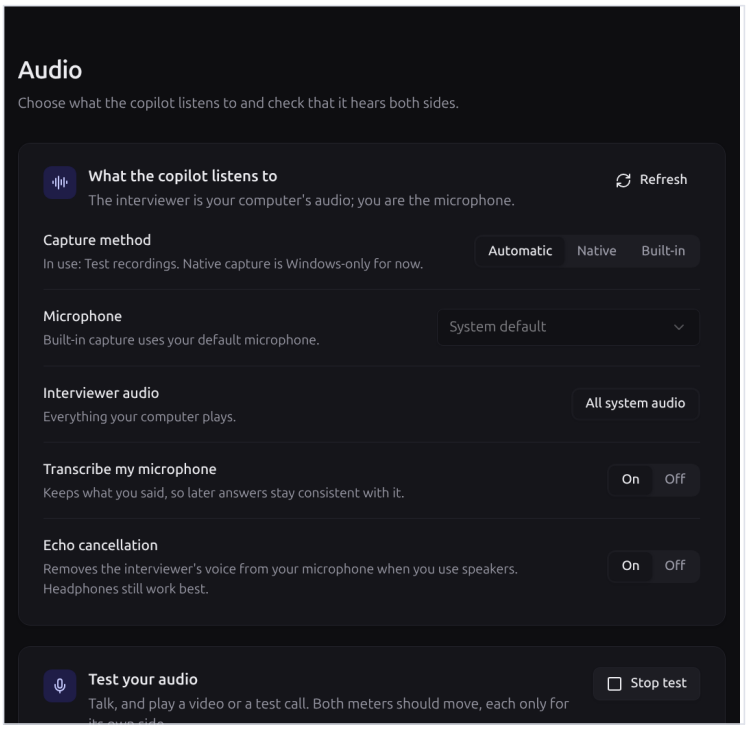

The Answer bank drafts answers to common questions ("Tell me about yourself", "Why this company?") and to questions likely for the role, from your profile and notes only. Drafts are not used until you **approve** them. During an interview, an approved answer that matches the question is shown at once, with no waiting for the AI.

The Answer bank: drafts wait for your approval. Try a question shows which answer would be used.

Step 4 · Test your audio (Audio)

- **Microphone**: your voice. **Interviewer audio**: **All system audio** (everything your computer plays) or **One app** (only the call app, such as Zoom or Teams).
- On the Audio page, click **Start test**, then talk and play a video or a test call. **Both meters should move, each only for its own side.**
- With **Transcribe during the test** on, you also see the words, so you know transcription works.
- **Capture method**: **Automatic** uses the Windows audio module when it can. If the meters do not move, try **Built-in**.

The Audio page: what the copilot listens to, and the audio test.

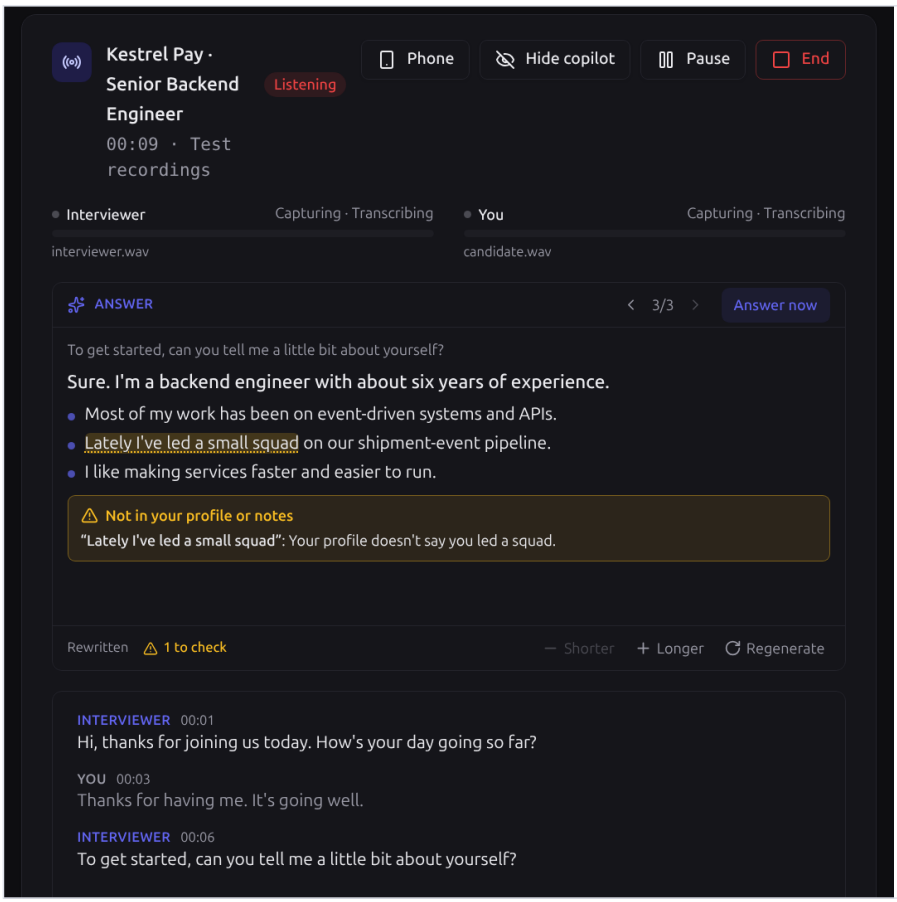

> **Headphones work best**
> With speakers, your microphone also picks up the interviewer. Echo cancellation (on by default) removes most of it, but headphones remove it completely.

3. During an interview

Start the interview a minute before the call. Keep the call app as it is: the copilot listens to your computer's sound and your microphone, and needs nothing from the call app itself.

Start

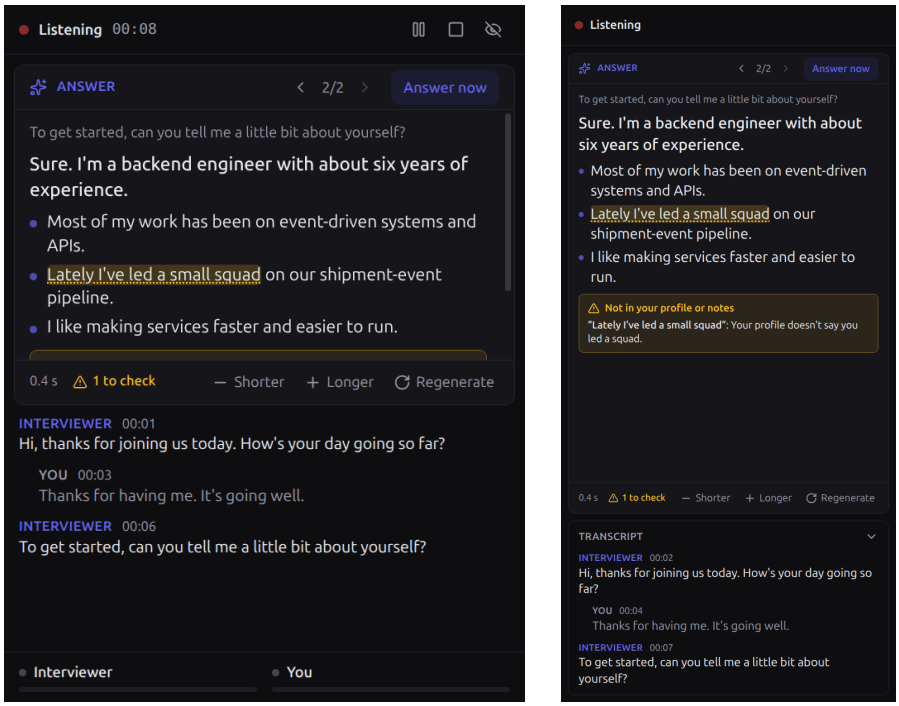

1. Go to **Interview**. Choose your **Profile** and **Knowledge** base, and type the **Company** and **Role** (they help with questions like "Why do you want to work here?").
2. Click **Start listening**. The copilot window opens over your call, and both meters start moving.
3. Talk normally. When the interviewer finishes a question, an answer appears in about one second.
4. When the call is over, click **End**. The transcript is saved in Sessions.

The Interview page during a call: meters, the answer card and the transcript. One phrase is underlined by the fact check.

The answer card

Part	What it means
The small grey line	The question the answer is for, as the app understood it.
The first, larger sentence	An opening you can say right away while you read the rest.
The points	Two to four short points from your own experience. Say them in your own words.
Yellow underline	The fact check could not find this in your profile or notes. The box below says why. The footer shows **1 to check** (or how many there are).
‹ 3/3 ›	Earlier answers in this interview. The newest is shown unless you go back.
Answer now	Answer what the interviewer just said, without waiting. If there is nothing new, it rewrites the last answer.
Shorter, **Longer**, **Regenerate**	A new answer to the same question. The earlier one stays one click away.
The time, for example 0.4 s	How long the answer took after the interviewer's last word. **On request** or **Rewritten** when you asked for it.

Left: the copilot window over your call. Right: the same answer on a phone.

The copilot window

- A small window that stays above the call window. Drag it where you like; it remembers its place.
- **Hide from screen sharing** (on by default): people who see your shared screen or a recording do not see it. This needs Windows 10 version 2004 or later.
- Its top bar shows the state (**Listening** or **Paused**) and the time, with buttons to pause, end and hide.
- Change its look in **Settings → Copilot window**: opacity, text size, always on top.

Keyboard shortcuts

Shortcuts work while the call app has focus, so you never need to click the copilot.

Action	Default shortcut
Show or hide the copilot	`Ctrl + Alt + Space`
Pause or resume listening	`Ctrl + Alt + P`
Answer now	`Ctrl + Alt + Enter`
Regenerate the answer	Not set. Choose one in Settings → Keyboard shortcuts.

To change one, open **Settings → Keyboard shortcuts**, click it and press the new keys. Avoid `Ctrl + Alt` with a letter if your keyboard uses AltGr for symbols, because that types a character instead.

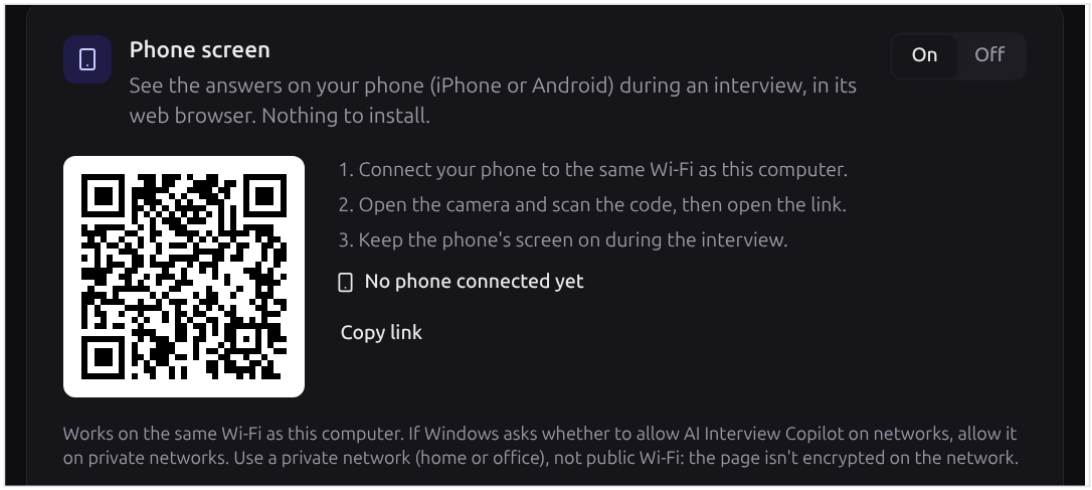

When the app answers and when it does not

- **It answers** questions ("How did you handle…?") and requests ("Tell me about…", "Walk me through…").
- **It waits** when the interviewer pauses in the middle of a sentence, or says a lead-in ("So, next topic…") and then the question.
- **It does not answer** plain statements ("Great, thanks."). Small talk gets a one- or two-sentence reply.
- **If it misses one,** press `Ctrl + Alt + Enter` (Answer now).
- With **Answer automatically** turned off (Settings → Answers), answers appear only when you ask.

Answers on your phone (optional)

Your phone can show the answers as a second screen. It is just a web page: nothing to install, on iPhone or Android.

1. On the computer: **Settings → Phone screen → On**. A QR code appears. During an interview, the **Phone** button on the Interview page shows the same code.
2. Connect the phone to the same Wi-Fi as the computer.
3. Scan the code with the phone's camera and open the link.
4. The phone shows the answer, its fact-check marks and the transcript. Its buttons (**Answer now**, **Shorter**, **Longer**, **Regenerate**) control the computer's copilot.

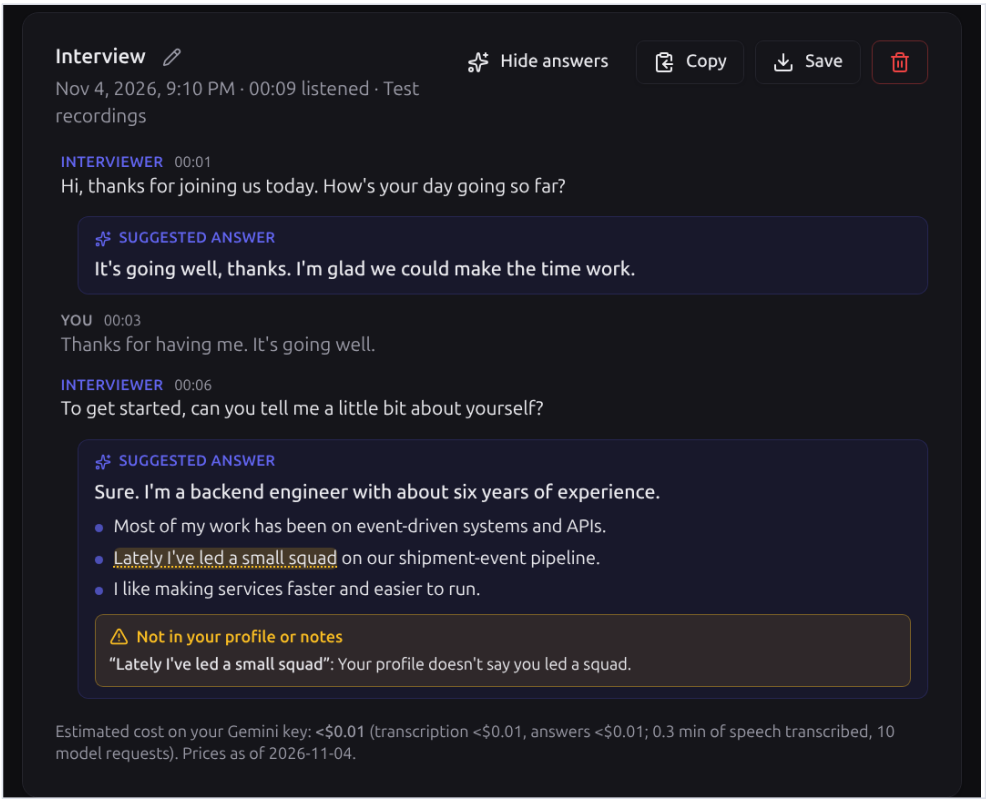

Settings → Phone screen: scan the QR code with the phone's camera.

- If Windows asks whether to allow AI Interview Copilot on networks, choose **private networks**.
- Keep the phone screen on. On iPhone, set Auto-Lock to Never for the interview.
- Phones stay paired across restarts. **Unpair all phones** disconnects all of them; they must scan again.
- Use a private network (home or office), not public Wi-Fi: the page is not encrypted on the network.

4. After the interview (Sessions)

Every interview is saved as text in Sessions. No audio is ever saved.

- Open a session to read the transcript. Suggested answers are shown under the questions they answered; **Hide answers** shows only what was said.
- **Copy** puts it on the clipboard; **Save** saves it as a text or Markdown file. Both include the answers when they are shown.
- Rename a session with the pencil icon, or delete it with the bin icon.
- At the bottom: the **estimated cost** of that interview on your Gemini key, with the minutes of speech transcribed and the number of model requests.
- Sessions are deleted automatically after **90 days**. Change this in **Settings → Privacy and data** (7 days, 30 days, 90 days, 1 year or forever).

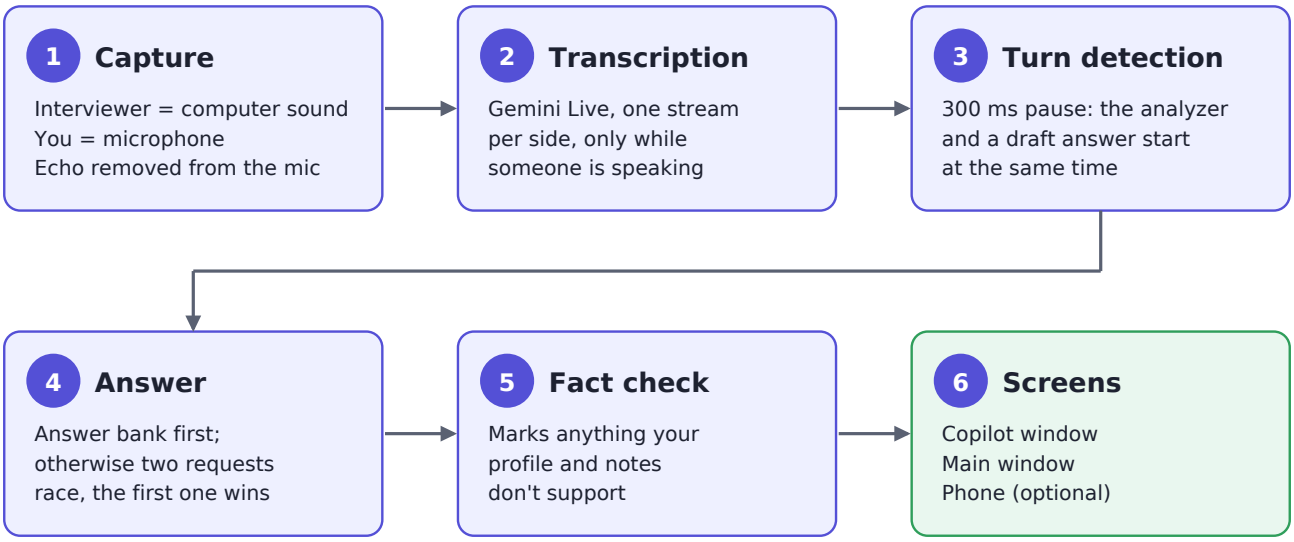

A saved session: transcript, suggested answers, the fact-check note and the estimated cost.

Tips for good answers

- **Your profile and notes are everything.** The app only uses what is in them. Add the stories you want to tell, with numbers.
- **Read the first sentence, then speak.** Say the points in your own words. Do not read them word for word.
- **Watch for yellow underlines.** They mark things your profile and notes do not support. Leave them out, or add the fact to your notes if it is true.
- **Use headphones** when you can. They keep the interviewer out of your microphone.
- **Do a test call** with the Audio test before an important interview.
- **Approve answers** in the Answer bank for questions you expect. They appear instantly.

5. How it works inside

This section explains what happens between the interviewer's last word and the answer on your screen. You do not need it to use the app.

The six steps of one question, from sound to screen.

1 · Capture: two separate channels

- **Interviewer** = your computer's sound (or one app's sound). **You** = your microphone. Because they come in separately, the app always knows who is speaking. No voice recognition is needed.
- Sound is captured by a small Windows audio module (WASAPI) as 16 kHz mono, in 20 ms pieces, on one shared clock. If the module cannot run, Electron's built-in capture is used instead.
- **Echo cancellation**: with speakers, your microphone also hears the interviewer. An adaptive filter learns the echo path from the interviewer's sound and subtracts it from your microphone, then a second stage removes what is left. In a simulated room it removed 47 dB of echo and passed your voice through.

2 · Transcription

- Each channel has its own live session with Gemini (`gemini-3.5-transcribe-live`).
- **Speech only**: the app sends audio only while someone is speaking (with 0.4 s before and 0.8 s after), which halves the cost. A short silence keeps the connection open between questions.
- Names from your profile (companies, tools) are given to the recognizer, so it spells them right.
- If the connection drops, it reconnects by itself.

3 · Turn detection: is the question finished?

- The app watches the interviewer's voice. After a **300 ms pause**, it starts two things at the same time:

- the **turn analyzer**, a fast model that decides: answer, wait (they are not done) or ignore (no question). It also rewrites a follow-up as a full question;
- a **draft answer**, so no time is lost if the analyzer says "answer".
- **Fast path**: if the text ends with "?" or is a finished request ("Tell me about…"), the answer is shown as soon as it streams. The analyzer can still withdraw it.
- If the interviewer keeps talking, the attempt is cancelled. If the text only gains punctuation, the draft is kept. After 1.2 s of silence the analyzer is asked again.
- A new question starts after an answer, after you spoke for 1 second or more, or after a statement and 1.5 s of silence.

4 · Writing the answer

- **Answer bank first**: if an approved prepared answer matches the question, it is shown at once, with no AI call. Matching is done on your computer in microseconds.
- Otherwise, the answer model receives: the rules (never invent experience, say honestly when you have none), the company and role, your profile, your notes, the interview so far (including what you said), and the latest question.
- The rules, profile and notes are the same for every request in an interview, so Gemini can cache them; that makes answers faster and cheaper.
- **Two identical requests race**, and the first to answer wins. Gemini's speed varies a lot, and the faster of two is much more steady. After a rate limit, racing is turned off for that interview.
- If the main model is slow or fails, a **backup model** answers instead.

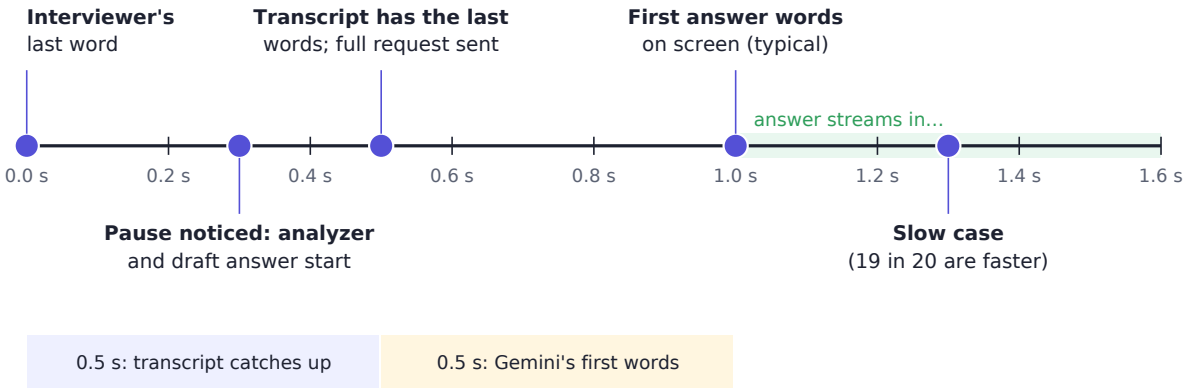

5 · Fact check

After each answer, a fast model (`gemini-3.5-flash-lite`) compares it with your profile and notes, and lists any statement they do not support, with an exact quote. The app underlines those words and explains why. It does not hold the answer back, so the mark can appear about a second after the answer. In tests it caught 17 of 18 planted false claims, with no false alarms on 15 true answers.

6 · Screens

The answer streams word by word to the copilot window, the Interview page and, if turned on, the phone. Everything is saved to the local database as it happens.

The timeline of one question

Typical timings measured with real Gemini. The fact check follows about 0.9 s after the answer is complete.

Of the one second, about half is the speech recognizer finishing the last words, and about half is Gemini starting to write. The app's own work is small.

The models it uses

Job	Default model	Notes
Transcription	`gemini-3.5-transcribe-live`	Live audio to text, one session per side
Turn analyzer	`gemini-3.5-flash-lite`	Decides answer / wait / ignore
Fast answers	`gemini-3.5-flash-lite`	The default answer mode, about 1 s
Quality answers	`gemini-3.1-pro-preview`	Stronger; about 5 s to the first words
Backup for live answers	`gemini-3.1-flash-lite`	A different model, so one outage does not stop both
Fact check	`gemini-3.5-flash-lite`	Checks each answer
Preparation	`gemini-3.1-pro-preview`	Resume, notes, Answer bank. Free keys: `gemini-3.8-flash`

You can change any of them in **Settings → Models**. The app lists the models your key can use, and skips a model your key does not have.

How the app is built

- **Main process**: windows, shortcuts, updates and the protected key store. It is kept light, so the windows never freeze.
- **Engine**: a separate background process runs the whole live pipeline and owns the database. If it crashes, it is restarted automatically.
- **Windows** (main, copilot, phone page) are sandboxed web pages with no direct access to your files.
- **Database**: SQLite on your computer, encrypted (ChaCha20-Poly1305).
- **Keys**: kept in Windows' protected storage (DPAPI). They never reach the windows, the database or the logs.

6. Your data and your key

The app has no server of its own. Your data stays on your computer, except what it must send to Google to transcribe and answer.

What	Where it goes	Kept where, for how long
Interview audio	Sent to Google Gemini while someone is speaking, to transcribe it	Never saved
Transcript and answers	The transcript text is sent to Gemini as context for answers	Local encrypted database; deleted after 90 days by default
Your resume file	Sent to Gemini once, when you import it (the app tells you first)	Local encrypted database
Profile and notes	Sent to Gemini with each answer and fact check	Local encrypted database
Your API key	Sent only to Google, with each request	Windows' protected storage (DPAPI)
Logs	Nowhere, unless you copy them	Local; they never contain your keys
Phone screen	Your local Wi-Fi only, to your paired phone	Nothing is stored on the phone

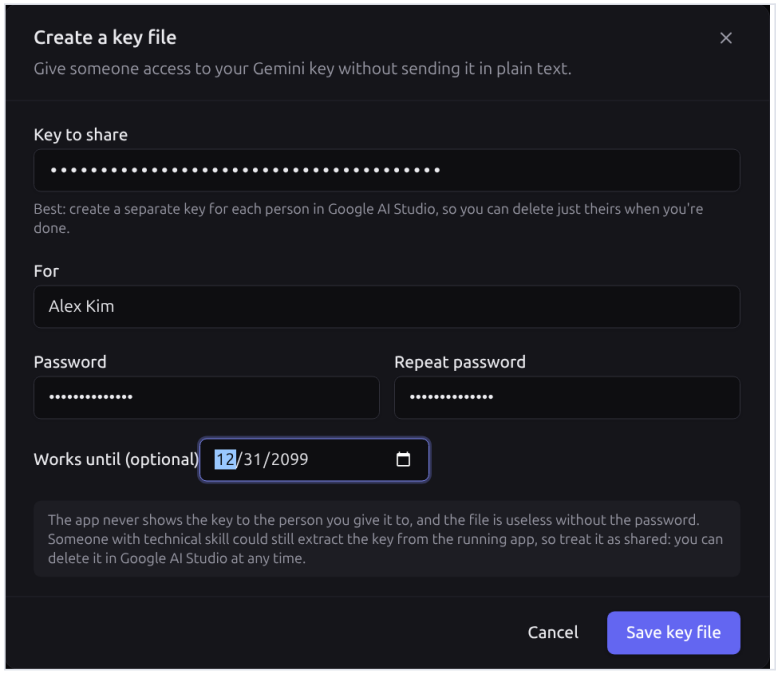

- **Settings → Privacy and data → Data folder → Open** shows the folder with the database, logs and settings.
- **Delete all local data** removes everything the app stored on this computer.
- Google bills the key's owner directly for what is used. Nobody else sees your interviews.

7. Sharing your key: key files

A key file lets someone use the app with your Gemini key, without you sending the key as plain text. They get a file and a password; the app never shows them the key.

Create a key file (owner)

1. Best: in Google AI Studio, create a **separate key for each person**. Then you can delete just theirs when you are done.
2. In the app: **Settings → Share your key → Create key file**.
3. Fill in **Key to share**, **For** (their name), a **Password** (at least 8 characters) and, if you like, **Works until**: after that date the app stops using the key.
4. Click **Save key file**. You get a file ending in `.aickey`.
5. Send the file and the password **by different channels**, for example the file by email and the password by phone.

Create a key file: who it is for, a password, and an optional end date.

Import a key file (the person you gave it to)

On Home, click **Someone gave you a key file? Import it** (or use **Have a key file?** in **Settings → Gemini API key**), choose the file and type the password. Settings then shows **From a key file**, with who it is for and the date it works until. The key itself is not shown and cannot be copied from the app's screens.

How it is protected

- The key is encrypted with AES-256-GCM. The password is stretched with scrypt ($N = 2^{17}$), so guessing passwords is slow.
- The name and the end date are part of the encrypted check, so they cannot be changed without the password.
- After import, the key is stored in Windows' protected storage, like your own key.

> **Know the limit**
> A key file stops the key from being read in an email or chat. It cannot stop a person with technical skill from pulling the key out of the running app on their own computer. Treat a shared key as shared: watch its use in Google AI Studio, and delete it there when the person no longer needs it. That stops it at once, everywhere.

8. Settings reference

Changes are saved automatically.

Setting	What it does	Default
Gemini API key	Add, check or remove the key. Google bills the key owner directly.	—
Share your key	Create an encrypted key file for someone else (section 7).	—
Models	Which Gemini model does each job. **Refresh model list** reloads what your key can use.	See section 5
Answers · **Answer automatically**	On: answers appear by themselves. Off: only when you ask (Answer now).	On
Answers · **Fact check**	Checks each answer against your profile and notes.	On
Answers · **Mode**	Fast (about 1 s) or Quality (a stronger model, about 5 s to the first words).	Fast
Answers · **Length**	Short, Standard or Detailed.	Standard
Audio · **Capture method**	Automatic, Native (the Windows audio module) or Built-in.	Automatic
Audio · **Interviewer audio**	All system audio, or One app (choose the call app).	All system audio
Audio · **Microphone**	Which microphone is you.	Windows default
Audio · **Transcribe my microphone**	Keeps what you said, so later answers stay consistent with it.	On
Audio · **Echo cancellation**	Removes the interviewer's voice from your microphone when you use speakers.	On
Copilot window · **Show when an interview starts**	Opens the copilot with each interview.	On
Copilot window · **Always on top**	Stays above the call window.	On
Copilot window · **Hide from screen sharing**	Invisible in screen sharing and recordings (Windows 10 2004 or later).	On
Copilot window · **Opacity**	100%, 96%, 85% or 70%.	96%
Copilot window · **Text size**	Small, Medium or Large.	Medium
Phone screen	Answers on your phone over the local Wi-Fi (section 3).	Off
Keyboard shortcuts	Show or hide the copilot, pause, answer now, regenerate.	See section 3
Appearance · **Theme**	System (follows Windows), Light or Dark.	System
Privacy · **Keep interview transcripts**	7 days, 30 days, 90 days, 1 year or forever.	90 days

Setting	What it does	Default
Privacy · **Delete all local data**	Removes everything the app stored on this computer.	—
About	Version, updates (Restart to update), logs.	—

9. What it costs

The app is free. Google charges the owner of the Gemini key for what is used, or nothing on the free tier.

An interview hour, estimated

Part	How it is billed	About
Transcription (both sides)	$0.009 per minute of audio sent. Only speech is sent: about 54 of 120 minutes	$0.49
Answers, turn analysis, fact check	About 25 questions × about $0.005 (two racing requests each)	$0.12
Total		**about $0.61**

- Assumes the interviewer speaks about 15 minutes and you about 35 in an hour. Prices are from Google's pricing page on 4 November 2026 (flash-lite: $0.30 per million input tokens, $2.50 per million output tokens).
- Each session shows its own **estimated cost** at the bottom (section 4).
- With a free key, the cost is $0 within Google's free-tier limits. If a limit is hit, live answers move to the backup model.
- When you share your key with a key file, the other person's interviews are billed to your key.

10. Measured speed and accuracy

Measured with real Gemini on recorded interview speech: 17 interviewer clips played in real time through the whole app.

Version	Typical (median)	Slow case (95th percentile)	What changed
Prototype	0.97 s	1.24 s	Proved the approach
Live answers (Phase 4)	1.15–1.36 s	1.44–1.87 s	The full app, three runs
Hardening (Phase 5)	1.23 s	1.46 s	Backup requests for slow responses
Faster answers (1.2.0 and later)	**1.0 s**	**1.3 s**	Racing requests, kept drafts, fast path for requests

The time is from the interviewer's last word to the first answer word on screen.

Check	Result
Right decision on 17 interview clips (answer, wait or ignore)	17 of 17, in every run; none withdrawn

Check	Result
Turn analyzer on 49 test phrases	All 30 finished questions answered; 3 of 16 answered too early at a mid-question pause
Fact check: planted false claims caught	17 of 18
Fact check: false alarms on true answers	0 of 15
Echo cancellation, simulated room	47 dB of echo removed; your voice transcribed word for word

Still to confirm
These numbers come from recorded speech on a development machine. Real calls on real Windows PCs, with real speakers and microphones, may differ.

11. Updates and releases

The app updates itself from the project's GitHub Releases. The owner decides when a new version goes out.

For users

- The app checks for a new version 15 seconds after it starts, then every 4 hours.
- It downloads in the background. Then **Restart to update** appears in the sidebar and in Settings → About.
- **It never restarts during an interview.** If you ignore it, the update installs the next time you quit.

For the owner: publishing a version

1. A version tag (for example `v1.3.0`) pushed to GitHub builds the Windows installer automatically.
2. The build creates a **draft** release. Nobody sees a draft.
3. Open GitHub → Releases, check the draft and click **Publish release**.
4. From then on, installed apps find the update by themselves, and new users can download it.

12. Fixing problems

Problem	What to do
"Windows protected your PC" when installing	Click **More info**, then **Run anyway**. The installer is not signed.
A meter does not move	Audio page: check the **Microphone** and **Interviewer audio** choices. Try **Capture method → Built-in**. For one app, make sure the call is playing.
The interviewer's words appear as yours	You are using speakers. Use headphones, or keep **Echo cancellation** on.
No answer appeared	Press `Ctrl + Alt + Enter` (Answer now). Check that **Answer automatically** is on.
Answers are slow or a rate limit is shown	Free keys have limits. The app moves to the backup model. A key with billing has higher limits.
An answer says something untrue	Look for the yellow underline, and leave it out. Add the true facts to your profile or notes. Use **Regenerate**.
"The key file you imported expired on…"	Ask the owner for a new key file, or add your own key.
The phone does not connect	Same Wi-Fi on both. Allow the app on **private networks** in the Windows firewall. Office, hotel and public Wi-Fi often block devices from seeing each other: use your phone's hotspot instead.
The phone says it is no longer paired	Someone used Unpair all phones. Scan the QR code again.
The phone screen turns off	Set Auto-Lock to Never (iPhone) or a long screen timeout (Android).
The copilot shows in screen sharing	Turn on **Hide from screen sharing**. It needs Windows 10 version 2004 or later.
Reporting a problem	Audio page → **Copy diagnostics**, or Settings → About → Logs. Logs never contain your keys.

13. Known limits

- **Windows only** for now. A macOS version is planned.
- **The phone is a second screen.** It needs the computer running the interview, on the same network. A phone-only version, listening with the phone's own microphone, would need a native app.
- **English only.**
- **Internet needed.** Transcription and answers run on Google Gemini.
- **The fact check can miss soft claims** (for example "I have been following your company"). Always read before you speak.
- **Not yet tested in real calls** on a range of Windows PCs. Real speakers, microphones and call apps may need tuning.
- **The installer is not signed,** so Windows shows a SmartScreen warning the first time.

In short

- Set up once: key, resume, notes, audio test.
- Start listening before the call. Read the first sentence, then speak in your own words.
- Watch for yellow underlines. Use Answer now when it misses a question.
- Afterwards, read the session and improve your notes for next time.
